

## Exporting and Rendering Premiere Pro

# Rendering

While working with premiere, you should notice in your timeline a coloured line sitting above your footage.

This is called the Render Line. Its to indicate what is and what is not, rendered.

Its important to render frequently while editing, so that effects, transitions and such can be seen in real-time and at full quality.

Leaving something un-rendered will give you a false sense of speed, time and quality.

Green – 100% rendered

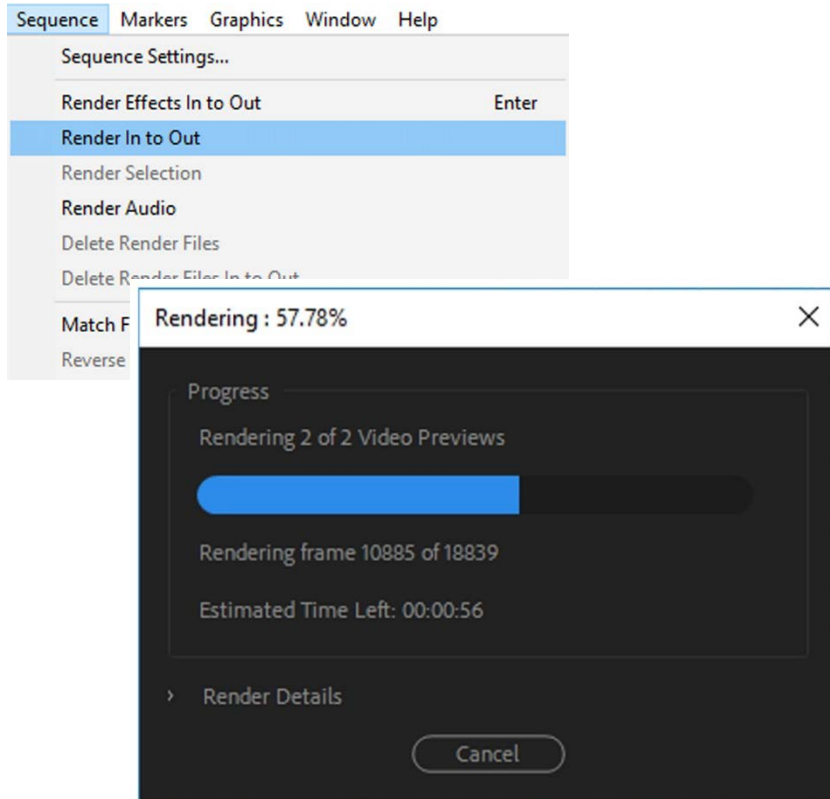

Yellow - 50% rendered – timings affected (NTR)

Red – 15% rendered – timings affected (NTR)

# Render Sequence

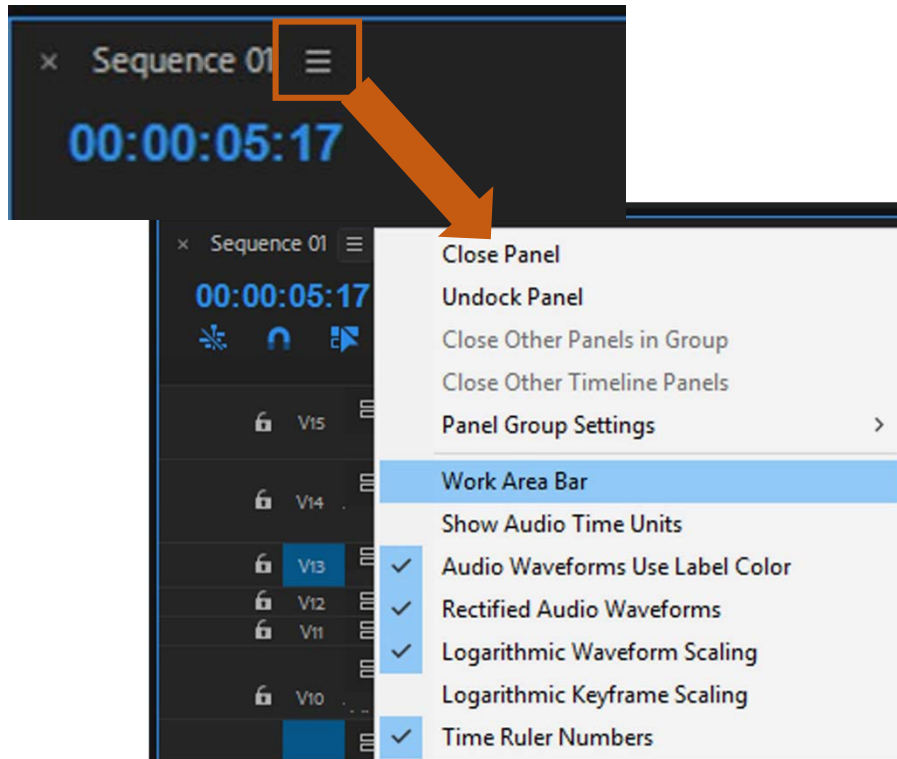

To render your footage. Go to the top right of the screen. Go Sequence > Render in to out.

This will render the whole of your timeline. Turning any yellow or red render lines to a nice solid green.

Depending on how many effects or transitions you have this may take some time to complete.

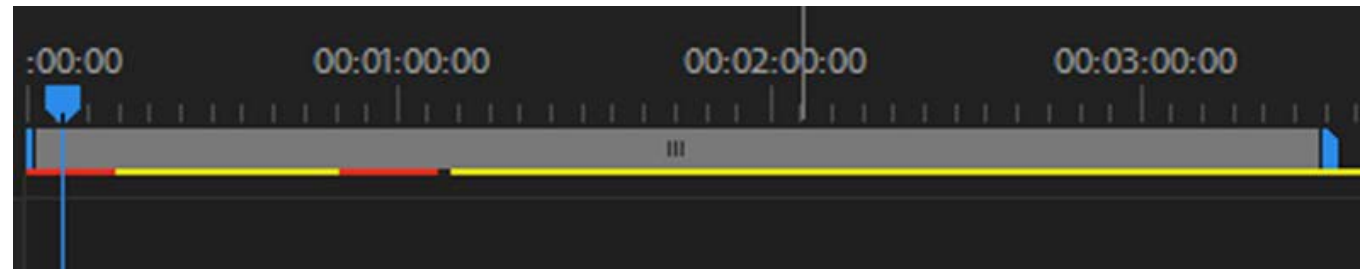

# Render Bar

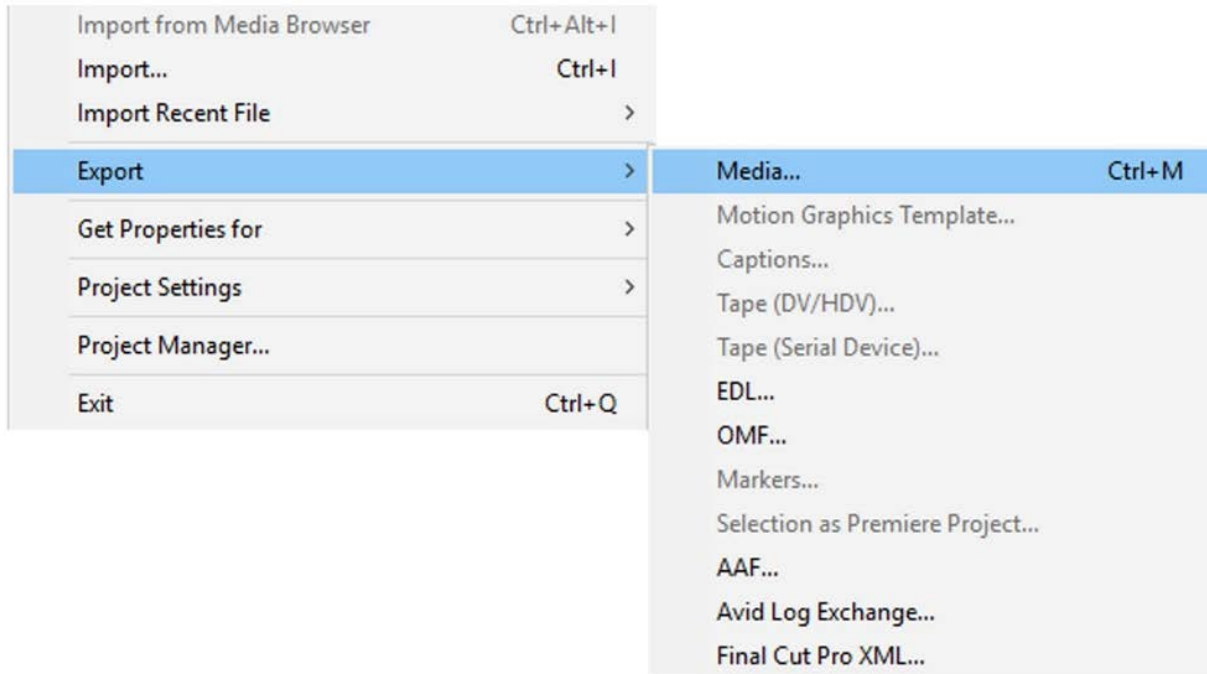

I tend to use the Render bar. This is a great tool for rendering. As you can change the bars width by dragging its blue ends. So you can decided how much you want to render. Great for an editor that's on the go.

Be sure that when you come to export, that the render bar is covering your whole project in the timeline as it also doubles up for an exports source range

# Exporting

When you are finished editing its time to export your film into its own video file.

To start this process, go File > Export > Media or shortcut Ctrl + M.

This will open up the export window for you to choose Formats, Preset's, Range and other export related options.

# Export window

Source Range: the range of your video you want to export. In/out? or Render bar?

Export Settings

- Match Sequence Settings
- Format: H264
- Preset: Match Source - High bitrate
- Comments:
- Output Name: Sequence 01.mp4
- Export Video  Export Audio

Summary

Output: E:\Sequence 01.mp4  
1920x1080 (1.0), 25 fps, Progressive, 00:12:33:14  
VBR, 1 pass, Target 10.00 Mbps, Max 12.00 Mbps  
AAC, 320 kbps, 48 kHz, Stereo

Source: Sequence, Sequence 01  
1920x1080 (1.0), 25 fps, Progressive, 00:12:33:14  
48000 Hz, Stereo

Basic Video Settings

- Width: 1920
- Height: 1080
- Frame Rate: 25

Estimated File Size: 927 MB

Export

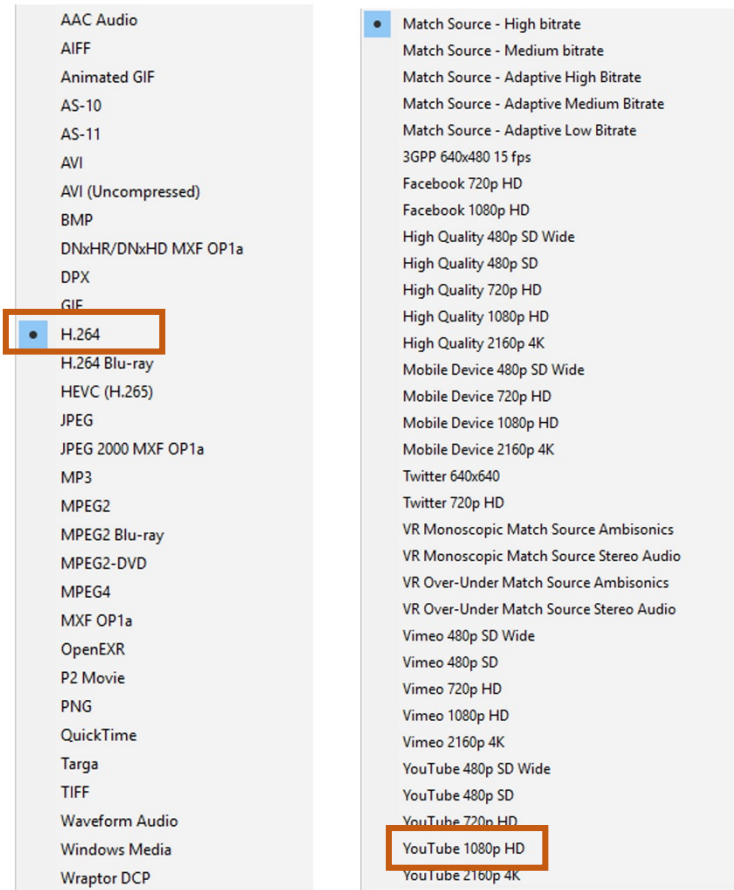

The Format you want your video file exported as.

The Preset you wish your video file to be exported as.

Double click this blue text here. To save where & what you want your video to be called.

Click "Export" to finalise.

# Settings?

Its important to read your briefs as to what format you are required to hand in.

Its also important to remember you cannot select a higher preset than what you filmed at.

I have highlighted a standard format and preset that I use working at 1080p.

Please feel free to ask any questions.
